1. What is Amazon EBS?

Amazon Elastic Block Store (EBS) is a block-level storage service provided by Amazon Web Services (AWS). It is mainly used with Amazon EC2 instances and works like a virtual hard disk. EBS provides persistent storage, which means data remains available even after the EC2 instance is stopped or restarted.

2.Amazon S3 (Simple Storage Service)

What is Amazon S3?

Amazon Simple Storage Service (S3) is an object storage service that stores data in the form of objects inside buckets. It is designed to store and retrieve any amount of data from anywhere.

3.Cinder (Block Storage Service – OpenStack)

What is Cinder?

Cinder is a block storage service in OpenStack. It provides storage volumes that work like virtual hard disks for virtual machines.

What Cinder Does • Creates volumes (virtual disks) • Attaches volumes to virtual machines • Used for OS disks and application data

4.Swift (Object Storage Service – OpenStack)

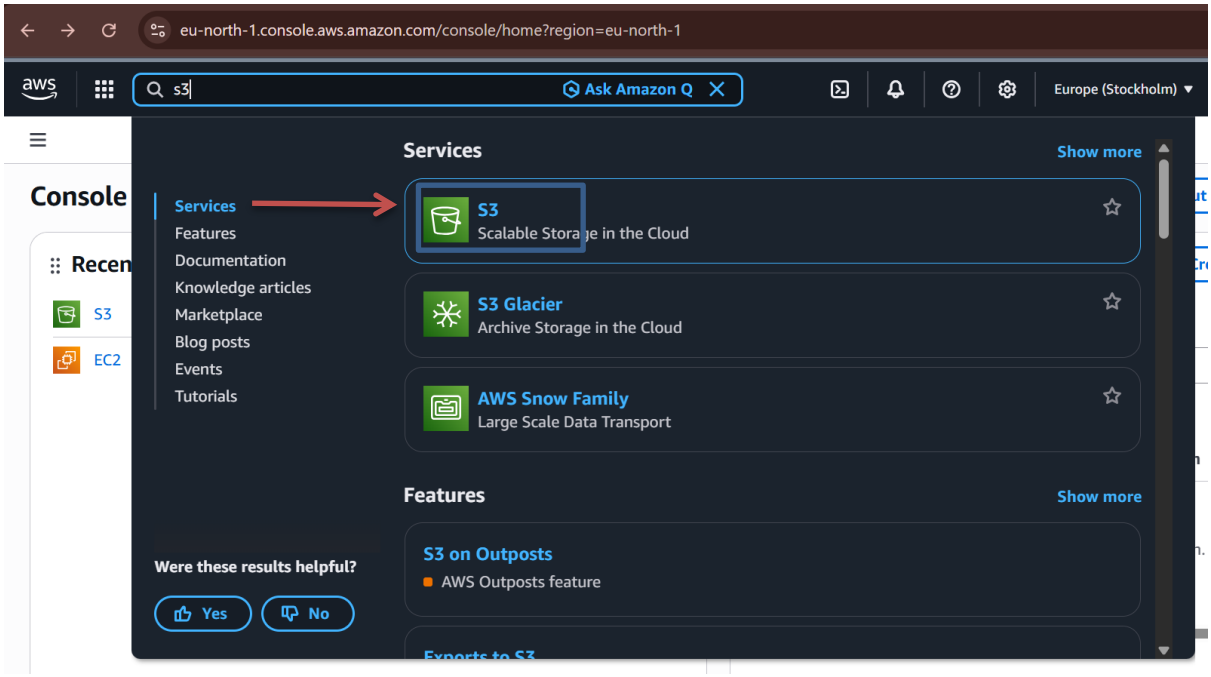
What is Swift?

Swift is an object storage service in OpenStack, similar to Amazon S3. It stores data as objects along with metadata and is accessed using REST APIs.

5.Steps to Create an Amazon S3 Bucket and Host a Static Website

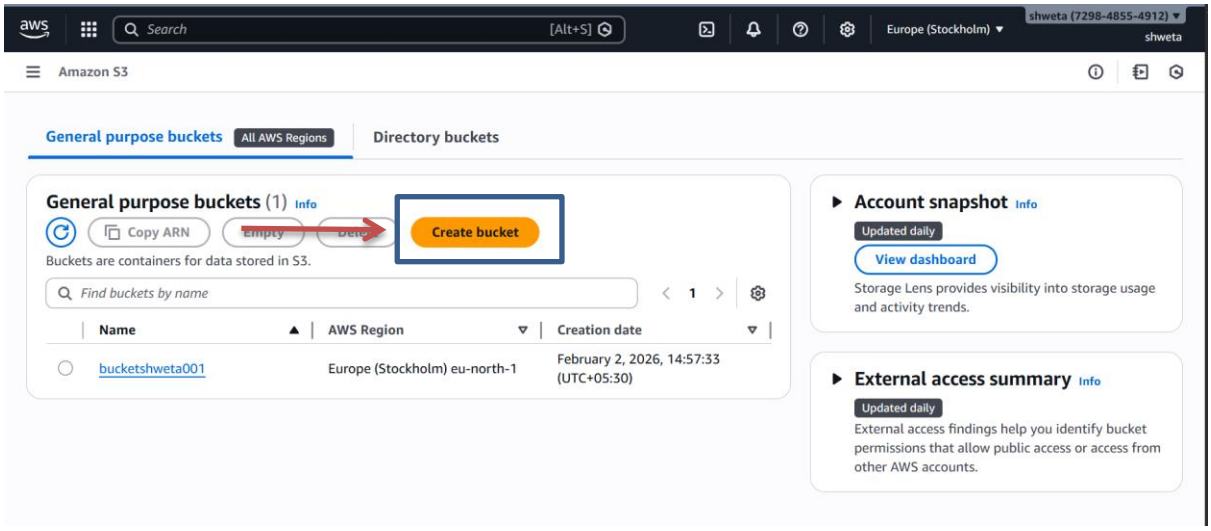
STEP 1: Login to AWS Console

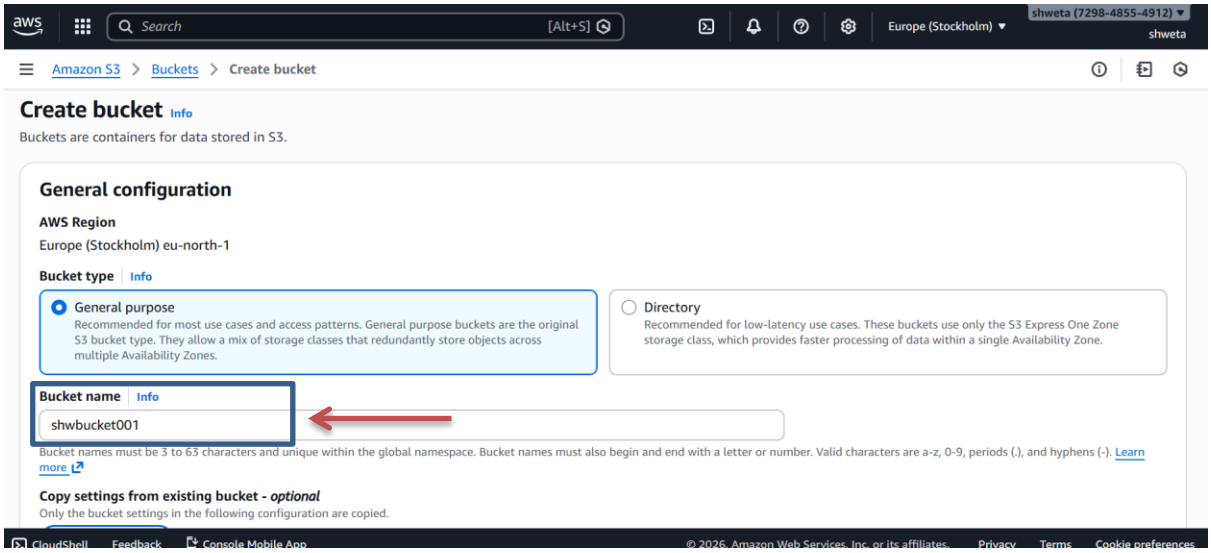
STEP 2: Open S3 Service Go to: Services → S3



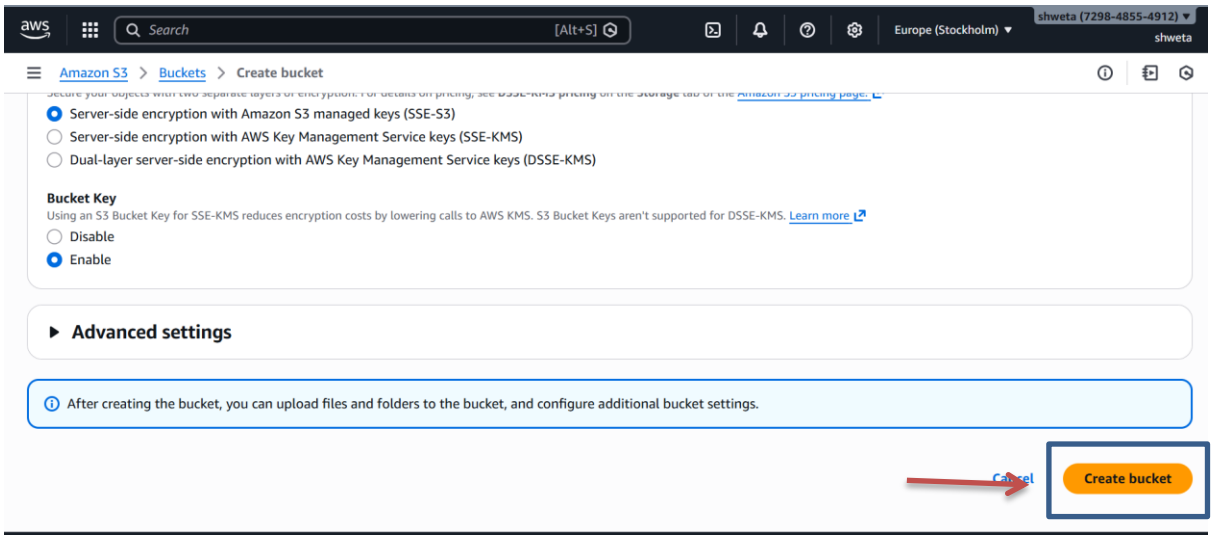
STEP 3: Create S3 Bucket Click: Create bucket

STEP 4: Enter Bucket Name & Region • Bucket name must be globally unique • Select the nearest AWS region

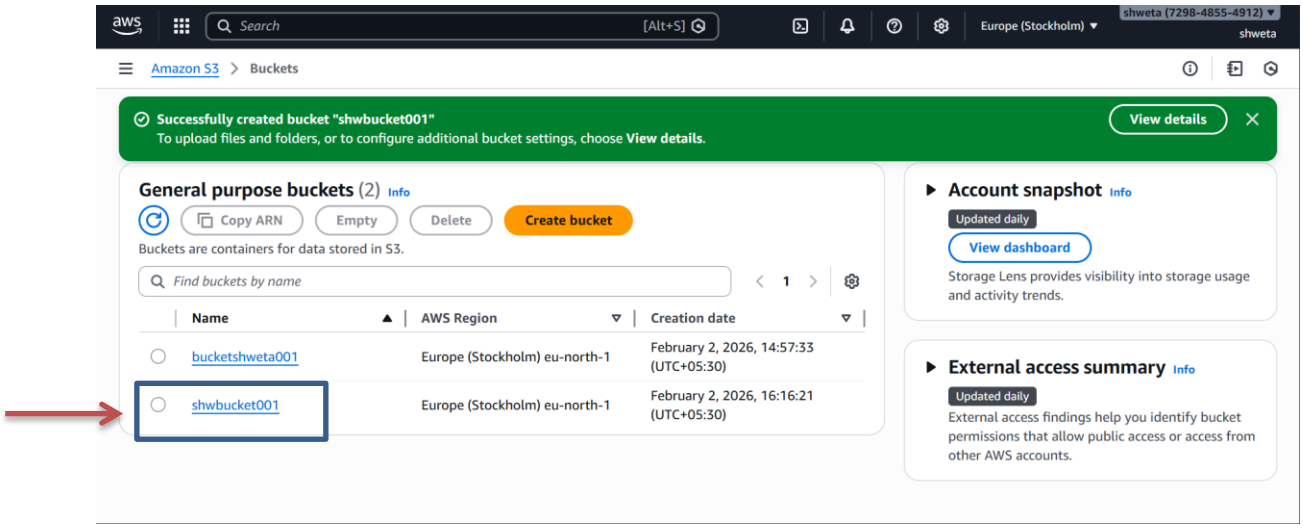




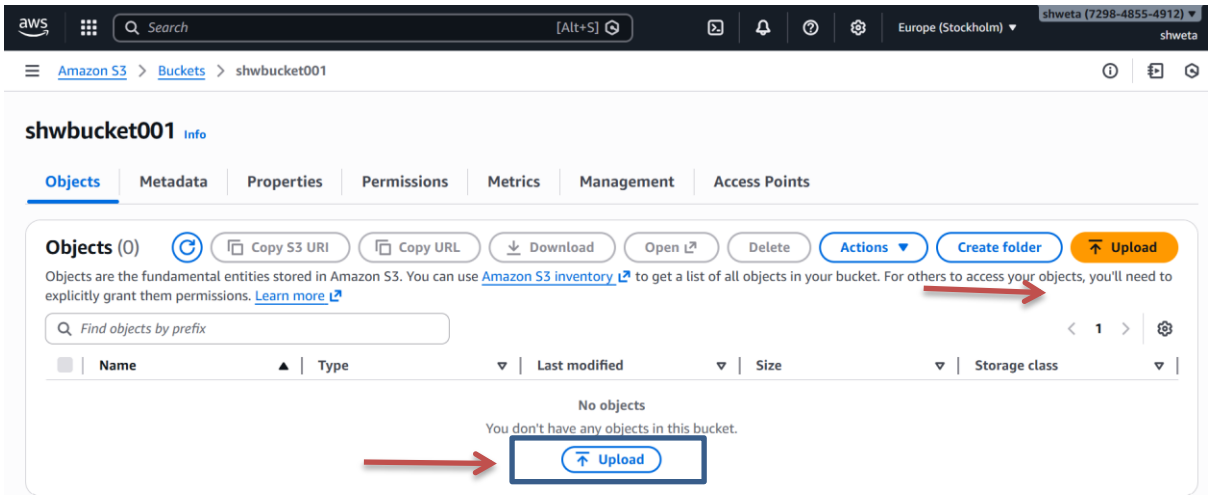
STEP 5: Create Bucket Click: Create bucket

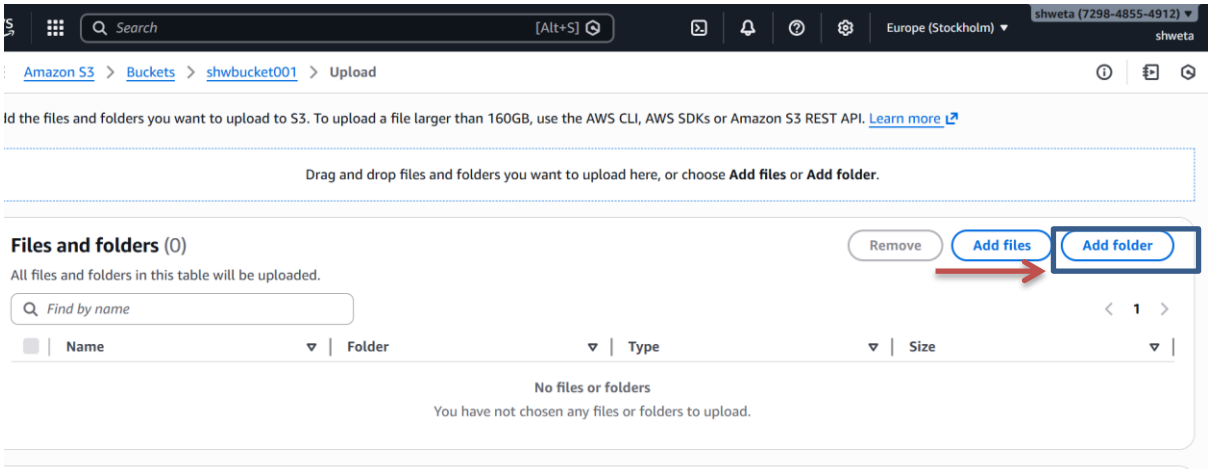


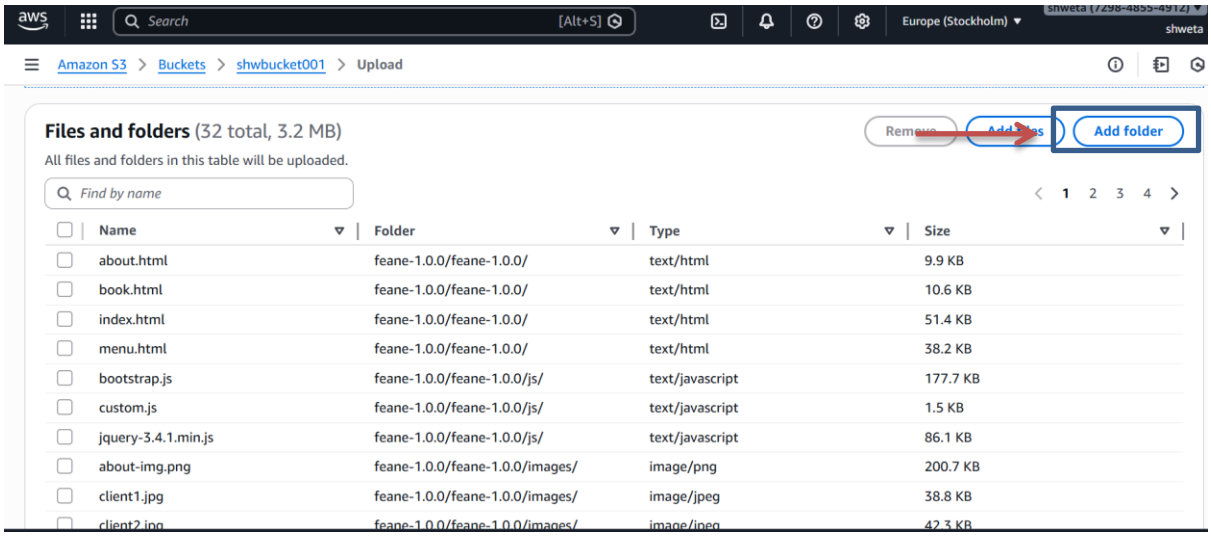
STEP 6: Open the Bucket Click on the created bucket name

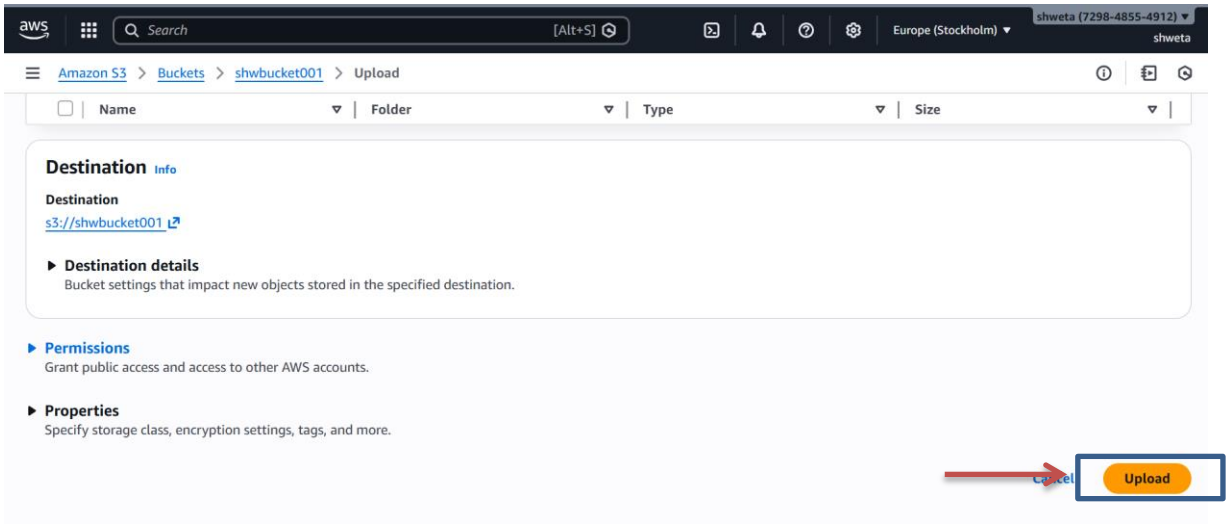


STEP 7: Upload Website Files Click: Upload → Add files / Add folder → Upload



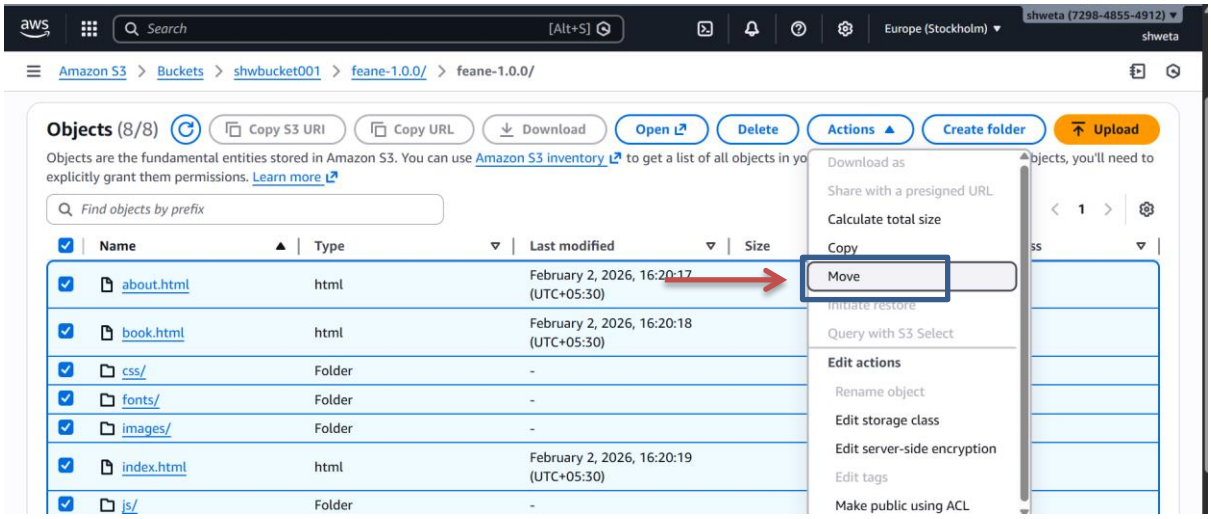


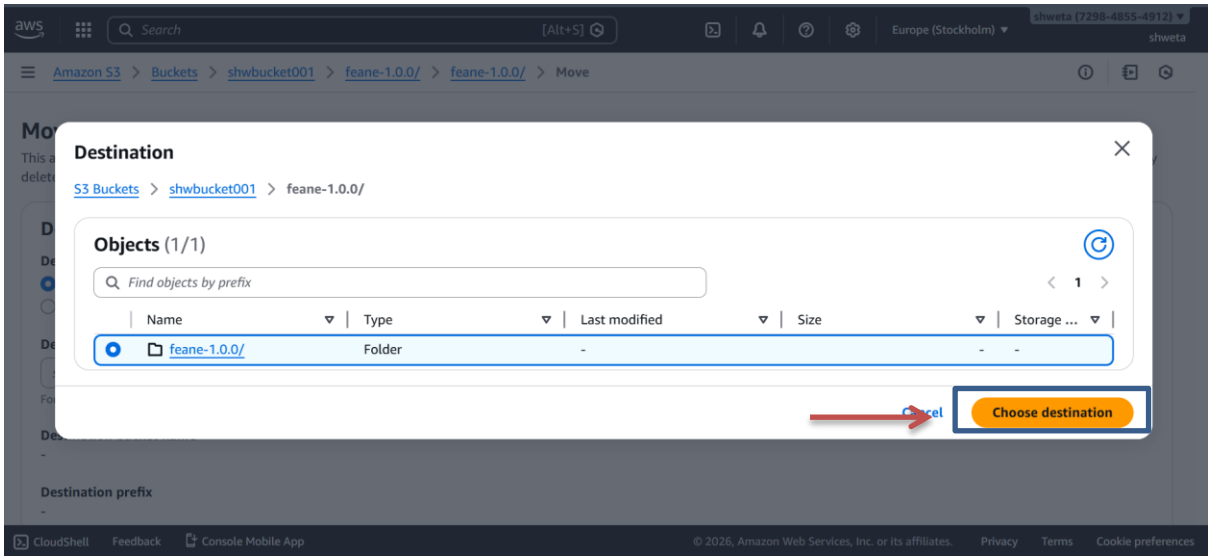


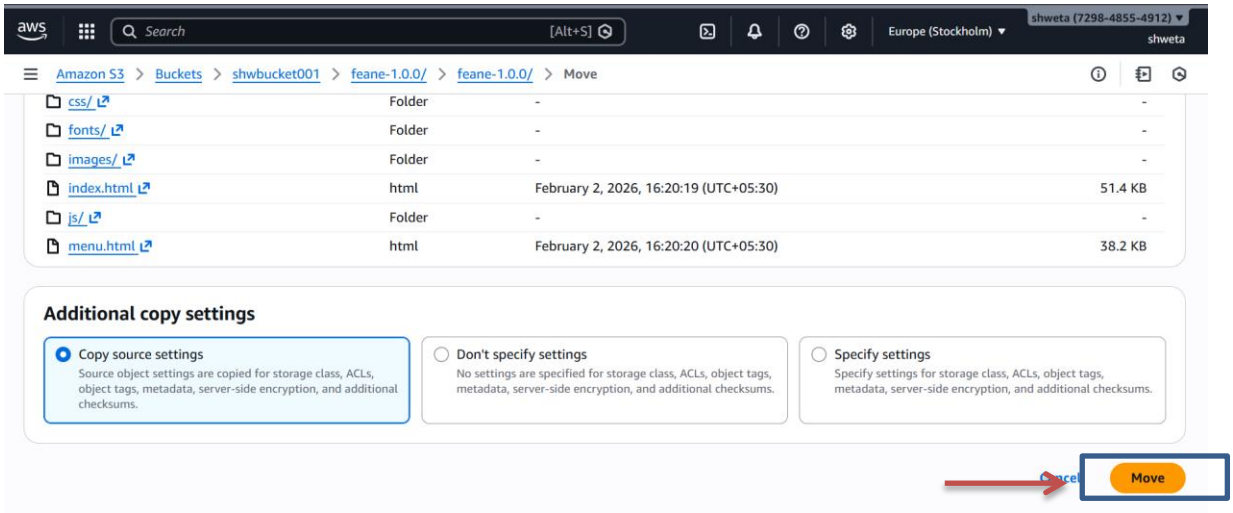


STEP 8: Select Website Files Select all website files (HTML, CSS, JS, images)

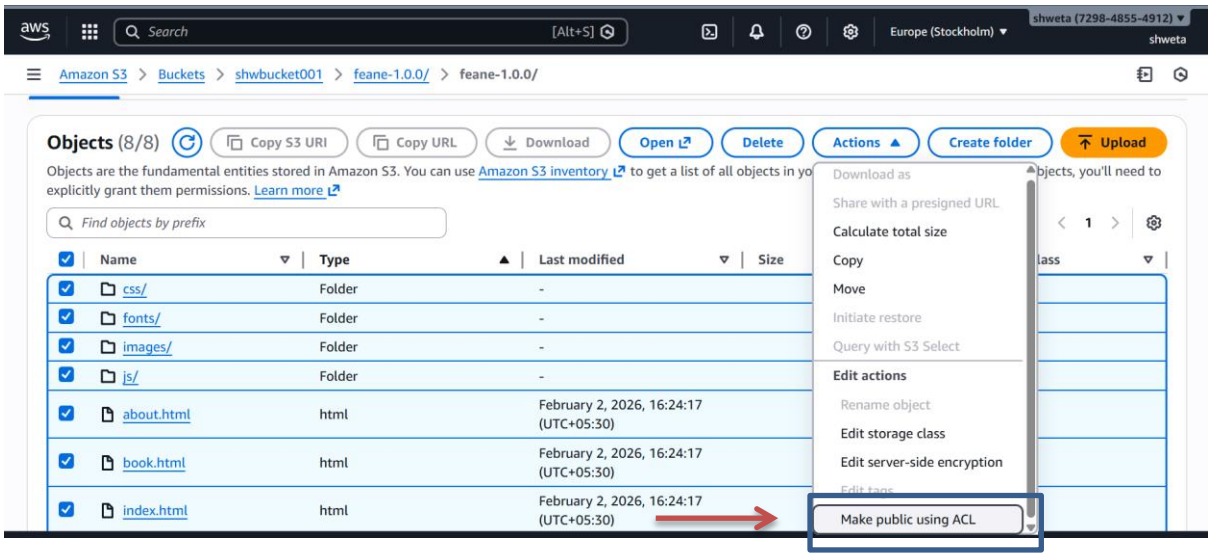
STEP 9: Move Files (Optional) Actions → Move Choose destination bucket or folder

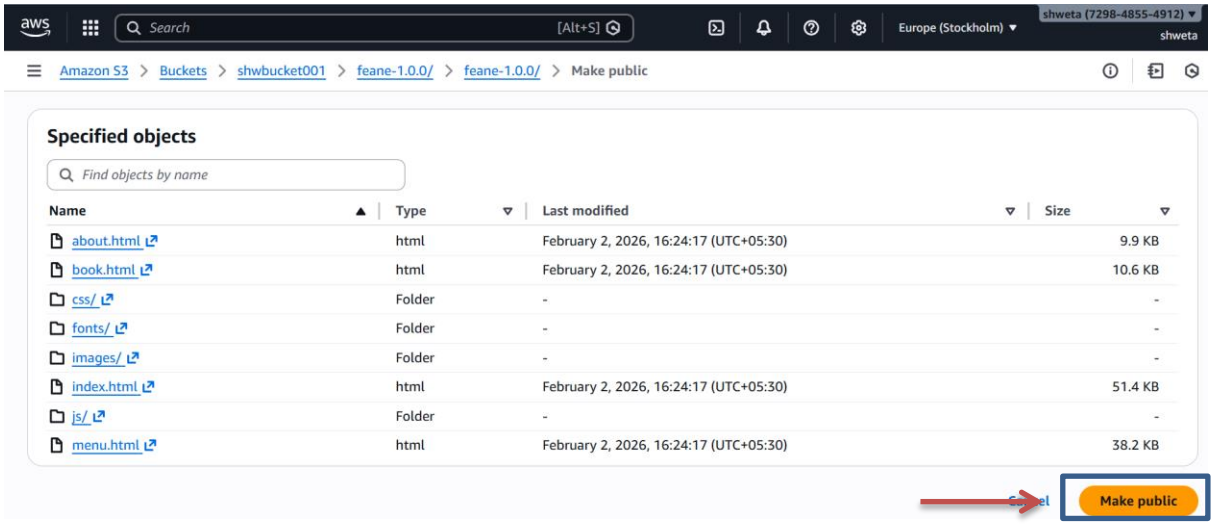




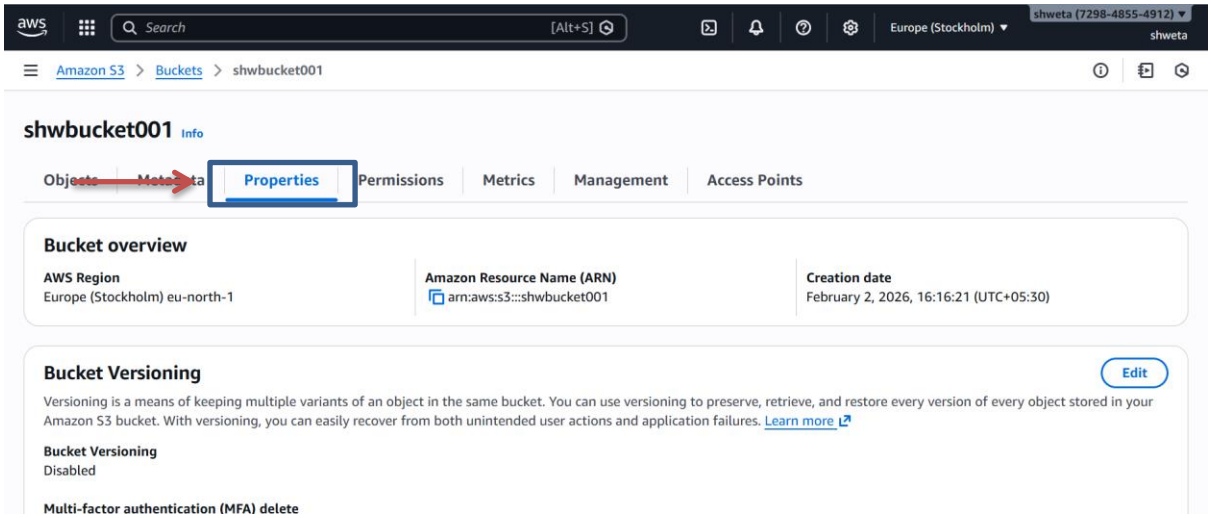


STEP 10: Make Website Files Public Select all files → Actions → Make public using ACL

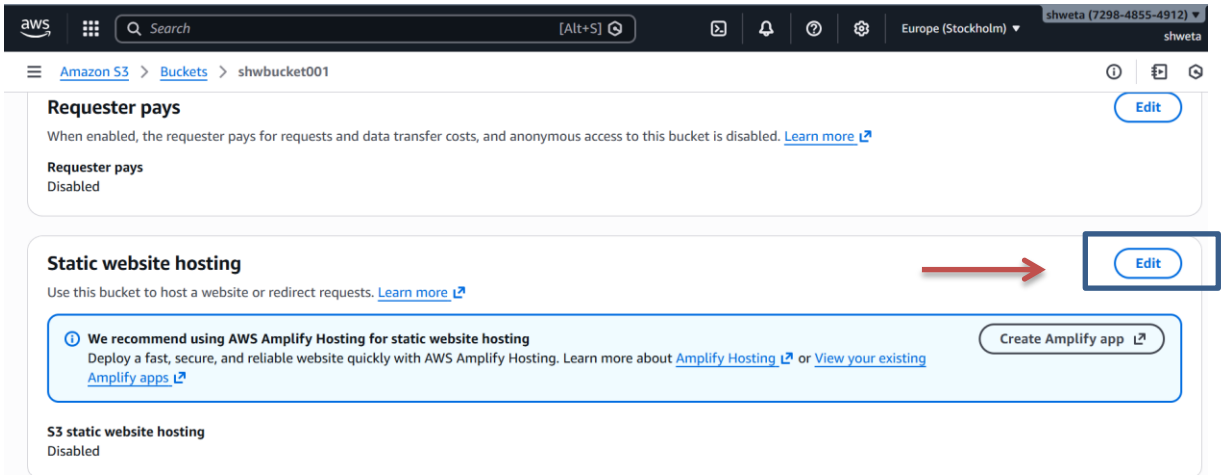


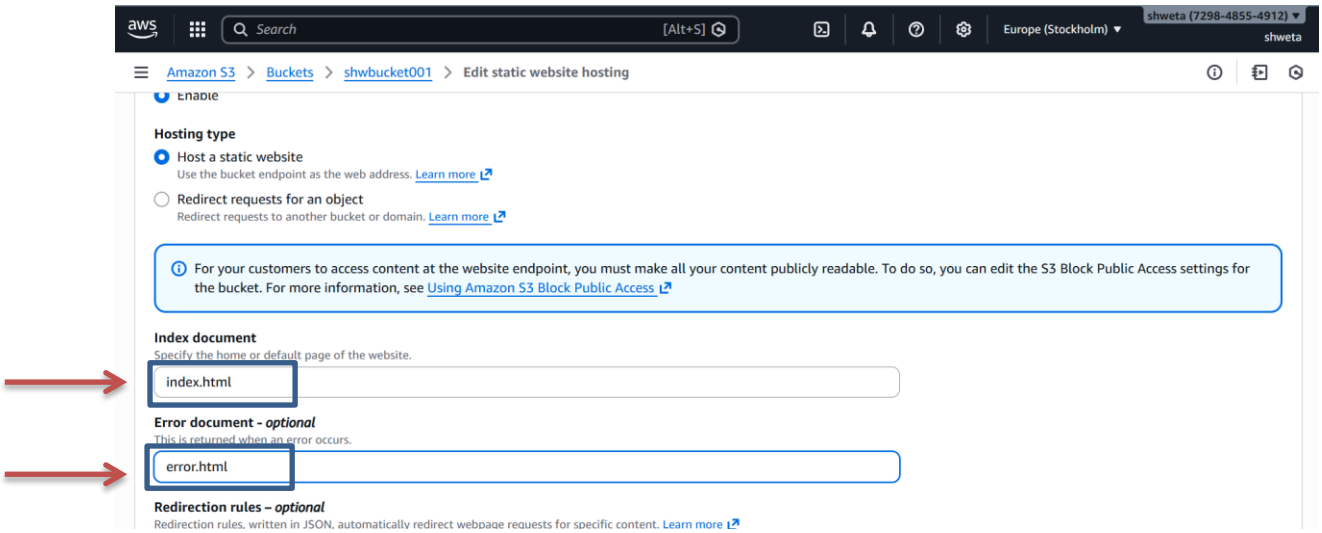


STEP 11: Enable Static Website Hosting Go to: Properties → Static website hosting → Edit • Enable static website hosting • Index document: index.html • Save changes

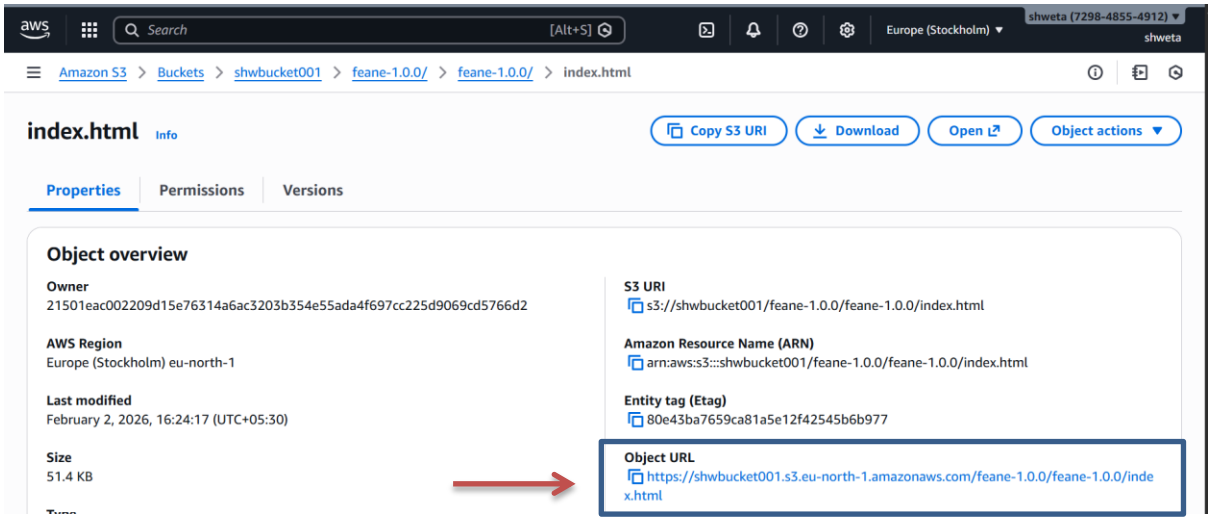


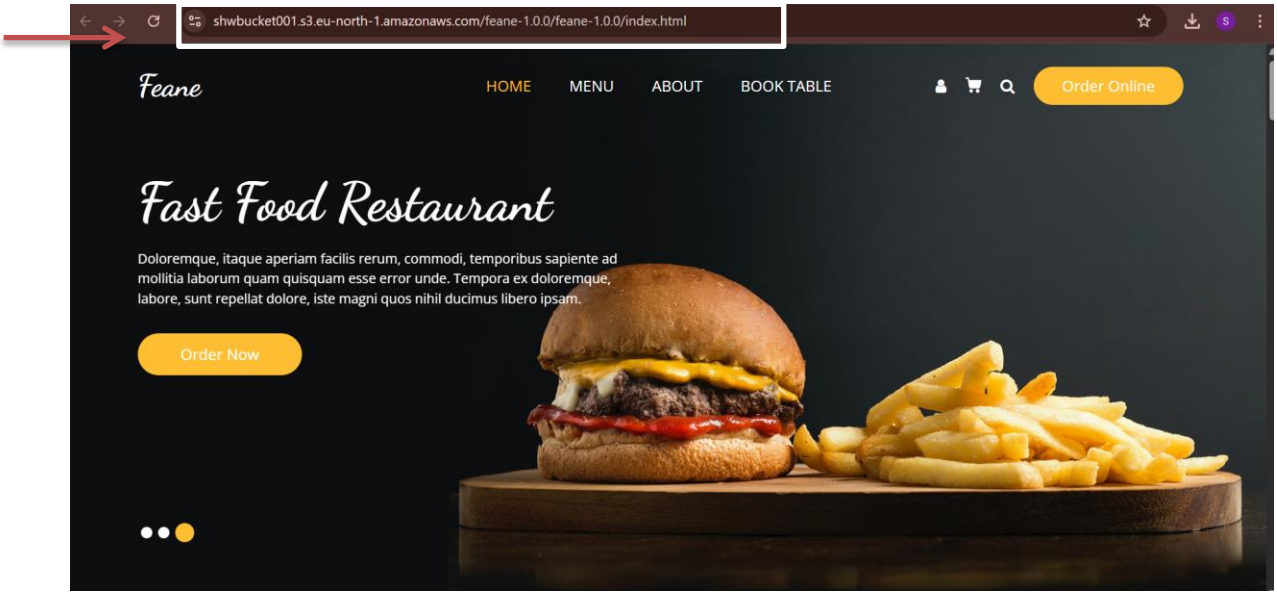
v





STEP 12: Copy Object URL Open index.html → Copy Object URL





STEP 13: Verify Website Output Paste the Object URL into a browser Confirm that the website loads successfully
